## PROJECT APPRAISAL

## What is the Investing?

Investing is where you use money to make more money.
There are so many methods that we can use to improve our money such as ,

1. Invest in the bank
2. Invest in the stock exchange market
3. Invest in a business etc

There is a risk when we invest. Risk should be minimized.
Example: some banks pay low interest, but they are having low risk.
Some banks give high interest, but they are high risk also.
How can you tell whether an investment is risky? Or which investment is more risky than others?
There are many ways to compare investments, but two of the most popular ways are:

1. Net Present Value
2. Internal Rate of Return

First let us learn what Present Value is?

## Present Value (PV)

Money now is more valuable than money later on.
Why? Because you can use money to make more money!
You could run a business, or buy something now and sell it later for more, or invest the money in the bank to earn interest.

Example
(1.) You can get $10 \%$ interest per annum on your money.

So Rs. 1,000 now can earn Rs. $1,000 \times 10 \%=$ Rs. 100 in a year.
Your Rs $\mathbf{1 , 0 0 0}$ now can become Rs. 1,100 in a year's time.

## Present Value Formula

$$
P V=F V \frac{1}{(1+r)^{n}}
$$

$F V=$ Future Value
$r=$ rate of return
$n=$ number of periods
Examples
(1) Arjuna promised you to pay Rs.2,000 in 4 years time. What is the Present Value (using at $10 \%$ rate of discount)?

- The Future Value (FV) is Rs.2,000,
- The interest rate (r) is $\mathbf{1 0 \%}$, which is $\mathbf{0 . 1 0}$ as a decimal, and
- The number of years $(\mathrm{n})$ is 4 .

So the Present Value of Rs.2, 000 in 4 years is:
$\mathrm{PV}=\mathrm{FV} /(1+\mathrm{r})^{\mathrm{n}}$
$P V=$ Rs. $2,000 /(1+0.10)^{4}$
$\mathrm{PV}=$ Rs.2, $000 / 1.10^{4}$
$\mathrm{PV}=$ Rs. $1,366.03$
It is saying that value is Rs. 1,366.03 now for Rs. $\mathbf{2 , 0 0 0}$ in 4 years (at $10 \%$ ).
(2) If you will get Rs. 3,000 in 3 years, what is the present Value (discounting rate is $10 \%$ )

The Future Value (FV) is Rs. $\mathbf{3 , 0 0 0}$,
The interest rate (r) is $\mathbf{1 0 \%}$, which is $\mathbf{0 . 1 0}$ as a decimal, and
The number of years ( n ) is $\mathbf{3}$.
So the Present Value of Rs.3,000 in $\mathbf{3}$ years is:
$\mathrm{PV}=\mathrm{FV} /(1+\mathrm{r})^{\mathrm{n}}$
$P V=$ Rs. $3,000 /(1+0.10)^{3}$
$\mathrm{PV}=$ Rs. $3,000 / 1.10^{3}$
$\mathrm{PV}=$ Rs. $\mathbf{2 , 2 5 3 . 9 5}$
It is saying that value is Rs. 2,253.95 now for Rs. $\mathbf{3 , 0 0 0}$ in $\mathbf{3}$ years (at $10 \%$ ).
(3) What is value now if you get Rs. 6,500 in next year at the rate of $10 \%$ ?

PV $=$ Rs. $6,500 /(1+0.10)^{1}=$ Rs. $6,500 / 1.10=$ Rs. $\mathbf{5 , 9 0 9 . 0 9}$ (to nearest cent)
(4) What is the value now if you get Rs. 6,500 in next year the rate of $15 \%$ ?
$\mathrm{PV}=$ Rs. $6,500 /(1+0.15)^{1}=$ Rs. 6,500/1.15 = Rs.5,652.17 (to nearest cent)

## Net Present Value

The NPV of a project or investment reflects the degree to which cash inflow, or revenue, equals or exceeds the amount of investment capital required to fund it.

STEPS TO CALCULATION NPV

1. Determine your initial investment
2. Determine a time period to analyze.
3. Estimate your cash flows for each time period
4. Determine the appropriate discount rate.
5. Discount your cash flows.

## Examples

(1) Amal needs Rs. 1,000 now, and will pay you back Rs. 1,350 in a year. Is that a good investment when you can get at $10 \%$ per year?

Cash OutFlow: Rs. 1,000 now
You invested Rs 1,000 now, so $P V=-$ Rs $\mathbf{1 , 0 0 0}$
Cash InFow: Rs 1,350 next year
$\mathrm{PV}=$ Rs $1,350 /(1+0.10)^{1}=$ Rs $1.350 / 1.10=$ Rs $\mathbf{1 , 2 2 7 . 2 8}$ (to nearest cent)
The Net Amount is:
Net Present Value $=$ Rs $1,227.28-1,000=$ Rs 227.28
If the Net Present Value (NPV) is positive it is good (and negative is bad).
(2) Invest Rs.20,000 now and receive 3 yearly payments of Rs.5,000 each, plus Rs.12,000 in the 3rd year. Use $10 \%$ discount Rate. Find NPV.

Initial investment = Rs. 20,000
Period $=3$ years
Discount rate $=10 \%$

Method 1

| Year | Cash Flow | DCF @ 10\% | Present Value |
| :---: | :--- | :--- | :--- |
| 0 | $(20,000.00)$ | 1.00 | $(20,000.00)$ |
| 1 | $5,000.00$ | 0.9091 | $4,545.45$ |
| 2 | $5,000.00$ | 0.8264 | $4,132.23$ |
| 3 | $5,000.00$ | 0.7513 | $3,756.57$ |
| 3 | $12,000.00$ | 0.7513 | $9,015.78$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{1 , 4 5 0 . 0 4}$ |

## Method 2

- Now: $\mathrm{PV}=-\mathrm{Rs} 20,000$
- Year 1: PV = Rs 5,000 / 1.10=Rs 4,545.45
- Year 2: $\mathrm{PV}=$ Rs $5,000 / 1.10^{2}=\operatorname{Rs} 4,132.23$
- Year 3: $\mathrm{PV}=$ Rs $5,000 / 1.10^{3}=$ Rs $3,756.57$
- Year 3 (final payment): $\mathrm{PV}=$ Rs $12,000 / 1.10^{3}=$ Rs $9,015.78$

Adding those and get:
$\mathbf{N P V}=-$ Rs $20,000+$ Rs 4,545.45+ Rs 4,132.23+ Rs 3,756.57+ Rs 9,015.78 = Rs $\mathbf{1 , 4 5 0 . 0 4}$

## This investment should be accepted.

(3) A project with a 3 year life and a cost of Rs. 100,000 generates revenue of Rs. 25,000 in year 1, Rs. 45,000 in year 2, and Rs. 65,000 in year 3. If the discount rate is $8 \%$, what is the NPV of the project?

Method 1

| Year | Cash Flow | DCF @ 8\% | Present Value |
| :---: | :--- | :--- | :--- |
| 0 | $(100,000.00)$ | 1.00 | $(100,000.00)$ |
| 1 | $25,000.00$ | 0.9259 | $23,148.15$ |
| 2 | $45,000.00$ | 0.8573 | $38,580.25$ |
| 3 | $65,000.00$ | 0.7938 | $51,599.10$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{1 3 , 3 2 7 . 4 9}$ |

NPV is positive then project should be accepted.

Method 2

- Now: PV = - Rs $\mathbf{1 0 0 , 0 0 0}$
- Year 1: PV = Rs $25,000 / 1.08=$ Rs 23,148.15
- Year 2: $\mathrm{PV}=$ Rs $45,000 / 1.08^{2}=$ Rs $\mathbf{3 8 , 5 8 0 . 2 5}$
- Year 3: $\mathrm{PV}=$ Rs $65,000 / 1.08^{3}=$ Rs $\mathbf{5 1 , 5 9 9 . 1 0}$

Adding those up gets:
$\mathbf{N P V}=-$ Rs $100,000+$ Rs $\mathbf{2 3 , 1 4 8 . 1 5 +}$ Rs $\mathbf{3 8 , 5 8 0 . 2 5 +}$ Rs $\mathbf{5 1 , 5 9 9 . 1 0 =}$ Rs $\mathbf{1 3}, \mathbf{3 2 7 . 4 9}$
(4) A project with a 4 year life and a cost of Rs. 225,000 generates revenue of Rs. 48,000 in year 1, Rs. 67,000 in year 2 , Rs. 95,000 in year 3 and Rs. 110,000 in year 4. If the discount rate is $15 \%$, Can be accepted the project?

| Year | Cash Flow | DCF @ 15\% | Present Value |
| :---: | :--- | :--- | :--- |
| 0 | $(225,000.00)$ | 1.00 | $(225,000.00)$ |
| 1 | $48,000.00$ | 0.8696 | $41,739.13$ |
| 2 | $67,000.00$ | 0.7561 | $50,661.63$ |
| 3 | $95,000.00$ | 0.6575 | $62,464.04$ |
| 4 | $110,000.00$ | 0.5718 | $62,892.86$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{( 7 , 2 4 2 . 3 4 )}$ |

Project cannot be accepted due to negative NPV.
Method 2

- Now: PV = - Rs 225,000
- Year 1: PV = Rs $48,000 / 1.15=$ Rs 41,739.13
- Year 2: $\mathrm{PV}=$ Rs $67,000 / 1.15^{2}=$ Rs $\mathbf{5 0 , 6 6 1 . 6 3}$
- Year 3: $\mathrm{PV}=$ Rs $95,000 / 1.15^{3}=$ Rs $\mathbf{6 2 , 4 6 4 . 0 4}$
- Year 4: $\mathrm{PV}=$ Rs $110,000 / 1.15^{4}=$ Rs $\mathbf{6 2 , 8 9 2 . 8 6}$

Adding those and get:
$\mathbf{N P V}=-$ Rs $225,000+$ Rs 41,739.13+ Rs 50,661.63+ Rs $\mathbf{6 2 , 4 6 4 . 0 4 + R s . ~ 6 2 , 8 9 2 . 8 6 = R s ( 7 , 2 4 2 . 3 4 )}$

## Internal Rate of Return (IRR)

Internal Rate of Return is the interest rate that makes the Net Present Value Zero.
And that "guess and check" method is the common way to find it (though in that simple case it could have been worked out directly).

## STEPS OF CALCULATION OF IRR

## Step 1: Select 2 discount rates for the calculation of NPVs

You can start by selecting any 2 discount rates on a random basis that will be used to calculate the net present values in Step 2.

It is important not to select discount rates that are ridiculously distant from the IRR (e.g. $10 \%$ and $90 \%$ ) as it could undermine accuracy.

## Step 2: Calculate NPVs of the investment using the $\mathbf{2}$ discount rates

You shall now calculate the net present values of the investment on the basis of each discount rate selected in Step 1.

## Step 3: Calculate the IRR

Using the 2 discount rates from Step 1 and 2 calculate net present values. Then you shall calculate the IRR

## Step 4: Interpretation

The decision rule for IRR is that an investment should only be selected where the cost of capital (WACC) is lower than the IRR.

The decision rule above will lead to the same conclusion as the NPV analysis where only one investment is being considered.

## Examples

(1) Invest Rs. 9,000 now, receive 3 yearly payments of Rs. 2,500 each, plus Rs. 4,000 in the 3rd year. Find IRR.

Let us try $10 \%$ discount rate:

| Year | Cash Flow | DCF @ 10\% | Present Value |
| :---: | ---: | ---: | ---: |
| 0 | $(9,000.00)$ | 1.00 | $(9,000.00)$ |
| 1 | $2,500.00$ | 0.9091 | $2,272.73$ |
| 2 | $2,500.00$ | 0.8264 | $2,066.12$ |
| 3 | $2,500.00$ | 0.7513 | $1,878.29$ |
| 3 | $4,000.00$ | 0.7513 | $3,005.26$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{2 2 2 . 3 9}$ |

Let us try $12 \%$ discount rate:

| Year | Cash Flow | DCF @ 12\% | Present Value |
| :---: | :--- | :--- | :--- |
| 0 | $(9,000.00)$ | 1.00 | $(9,000.00)$ |
| 1 | $2,500.00$ | 0.8929 | $2,232.14$ |
| 2 | $2,500.00$ | 0.7972 | $1,992.98$ |
| 3 | $2,500.00$ | 0.7118 | $1,779.45$ |
| 3 | $4,000.00$ | 0.7118 | $2,847.12$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{( 1 4 8 . 3 0 )}$ |

So close. Maybe 11.2\%

| Year | Cash Flow | DCF @ <br> $\mathbf{1 1 . 2 \%}$ | Present Value |
| :---: | :--- | :--- | :---: |
| 0 | $(9,000.00)$ | 1.00 | $(9,000.00)$ |
| 1 | $2,500.00$ | 0.8993 | 2,249 |
| 2 | $2,500.00$ | 0.8088 | 2,022 |
| 3 | $2,500.00$ | 0.7273 | 1,819 |
| 3 | $4,000.00$ | 0.7273 | 2,910 |
|  | $\mathbf{N P V}$ |  | $\mathbf{0}$ |

Then IRR is $\mathbf{1 1 . 2}$ \%

## Method 2

Let us try $10 \%$
Now: PV = -Rs. 9,000

- Year 1: PV = Rs. 2,500 / $1.10=$ Rs. 2,272.73
- Year 2: $\mathrm{PV}==$ Rs. $2,500 / 1.10^{2}=$ Rs. $2,066.12$
- Year 3: $\mathrm{PV}==$ Rs. $2,500 / 1.10^{3}=$ Rs. $1,878.29$
- Year 3 (final payment): $\mathrm{PV}=$ Rs. $4,000 / 1.10^{3}=$ Rs. $3,005.26$
- Adding those up gets: NPV = Rs 222.39

Let us try at $12 \%$ discount rate:

- Now: PV = -Rs. 9,000
- Year 1: PV = Rs. 2,500 / $1.12=$ Rs. 2,232.14
- Year 2: $\mathrm{PV}==$ Rs. $2,500 / 1.12^{2}=$ Rs. $1,992.98$
- Year 3: $\mathrm{PV}==$ Rs. $2,500 / 1.12^{3}=$ Rs. $1,779.45$
- Year 3 (final payment): $\mathrm{PV}=$ Rs. $4,000 / 1.12^{3}=$ Rs. $2,847.12$
- Adding those up gets: $\mathbf{N P V}=\operatorname{Rs}(\mathbf{1 4 8 . 3 0})$

So close. Maybe 11.2\%

- Now: PV = -Rs. 9,000
- Year 1: PV = Rs. 2,500 / $1.112=$ Rs. 2,249
- Year 2: $\mathrm{PV}==$ Rs. $2,500 / 1.112^{2}=$ Rs. 2,022
- Year 3: $\mathrm{PV}==$ Rs. $2,500 / 1.112^{3}=$ Rs. 1,819
- Year 3 (final payment): $\mathrm{PV}=$ Rs. $4,000 / 1.112^{3}=$ Rs. 2,910
- Adding those up gets: $\mathbf{N P V}=$ Rs. 0

Then IRR is $11.2 \%$
(2) Find the IRR of an investment having initial cash outflow of Rs. 280,000. The cash inflows at first, second, third and fourth years are expected to be Rs. 72,000 , Rs. 97,000 , Rs.105,000 and Rs, 110,000 respectively.

| Year | Cash Flow | DCF @ 10\% | Present Value |
| :---: | :--- | :--- | :--- |
| 0 | $(280,000.00)$ | 1.00 | $(280,000.00)$ |
| 1 | $72,000.00$ | 0.9091 | $65,454.55$ |
| 2 | $97,000.00$ | 0.8264 | $80,165.29$ |
| 3 | $105,000.00$ | 0.7513 | $78,888.05$ |
| 4 | $110,000.00$ | 0.6830 | $75,131.48$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{1 9 , 6 3 9 . 3 7}$ |

Let us try at $13 \%$

| Year | Cash Flow | DCF @ 13\% | Present Value |
| :---: | ---: | ---: | ---: |
| 0 | $(280,000.00)$ | 1.00 | $(280,000.00)$ |
| 1 | $72,000.00$ | 0.8850 | $63,716.81$ |
| 2 | $97,000.00$ | 0.7831 | $75,965.23$ |
| 3 | $105,000.00$ | 0.6931 | $72,770.27$ |
| 4 | $110,000.00$ | 0.6133 | $67,465.06$ |
|  | NPV |  | $\mathbf{( 8 2 . 6 3 )}$ |

Assume that r is $10 \%$.
NPV at $10 \%$ discount rate $=$ Rs. 19,639.37
Since NPV is greater than zero we have to increase discount rate, thus NPV at 13\% discount rate = Rs. (82.63)

Since NPV is fairly close to zero at $13 \%$ value of $r$, therefore
IRR $\approx 13 \%$

## Formula

Where:

NPV2 = Lower Net Present Value (derived from R2)
(3) Mr. Amila is considering to invest Rs. 350,000 in a Hardware business. The cash inflows during the first, second and third years are expected to be Rs. 125,000 , Rs. 150,000 and Rs, 170,000 respectively.

Cost of capital is $11 \%$
Calculate the IRR for the proposed investment and interpret your answer.
Step 1 : Select 2 discount rates
$\mathrm{R} 1=10 \%$ and $\mathrm{R} 2=15 \%$
Step 1 : Find NPVs of the investment using 2 discount rates
at $10 \%$

| Year | Cash Flow | DCF @ <br> $\mathbf{1 0 \%}$ | Present <br> Value |
| :---: | :--- | :--- | :--- |
| 0 | $(350,000.00)$ | 1.00 | $(350,000.00)$ |
| 1 | $125,000.00$ | 0.9091 | $113,636.36$ |
| 2 | $150,000.00$ | 0.8264 | $123,966.94$ |
| 3 | $170,000.00$ | 0.7513 | $127,723.52$ |
|  | NPV1 |  | $\mathbf{1 5 , 3 2 6 . 8 2}$ |

at $15 \%$

| Year | Cash Flow | DCF @ <br> $\mathbf{1 5 \%}$ | Present <br> Value |
| :---: | :--- | :--- | :--- |
| 0 | $(350,000.00)$ | 1.00 | $(350,000.00)$ |
| 1 | $125,000.00$ | 0.8696 | $108,695.65$ |
| 2 | $150,000.00$ | 0.7561 | $113,421.55$ |
| 3 | $170,000.00$ | 0.6575 | $111,777.76$ |
|  | NPV2 |  | $(\mathbf{1 6 , 1 0 5 . 0 4 )}$ |

Step 3 : Calculate the IRR
Internal Rate of Return $=\mathrm{R} 1 \%+\frac{\mathrm{NPV} 1 \times(\mathrm{R} 2-\mathrm{R} 1) \%}{(\mathrm{NPV} 1-\mathrm{NPV} 2)}$

$$
\begin{aligned}
& =10 \%+\frac{\mathbf{1 5 , 3 2 6 . 8 2} \times(15-10) \%}{(\mathbf{1 5 , 3 2 6 . 8 2}-(-16,105.04))} \\
& =10 \%+\frac{\mathbf{1 5 , 3 2 6 . 8 2 \times 5})}{(\mathbf{1 5 , 3 2 6 . 8 2}+\mathbf{1 6 , 1 0 5 . 0 4})} \\
& =10 \%+2.44 \%
\end{aligned}
$$

$$
\text { IRR } \quad=\mathbf{1 2 . 4 4 \%}
$$

Step 4 : Interpretation
The investment should be accepted by Amila because the cost of capital (i.e $11 \%$ ) is lower than the IRR of $12.44 \%$

## IRR Calculation

The calculation of IRR is a bit complex. We know that at IRR, Net Present Value (NPV) is zero, thus:
NPV $=0$; or
PV of future cash flows - Initial Investment $=0$; or
$\left[\frac{\mathrm{CF}_{1}}{(1+\mathrm{r})^{\mathrm{I}}}+\frac{\mathrm{CF}_{2}}{(1+\mathrm{r})^{2}}+\frac{\mathrm{CF}_{3}}{(1+\mathrm{r})^{3}}+\ldots\right]-$ Initial Investment $=0$
Where,
$\mathbf{r}$ is the internal rate of return;
$\mathbf{C F}_{1}$ is the period one net cash inflow;
$\mathbf{C F}_{2}$ is the period two net cash inflow,
$\mathbf{C F}_{3}$ is the period three net cash inflow, and so on ...

But the problem is, we cannot isolate the variable $\mathbf{r}$ (=internal rate of return) on one side of the above equation. However, there are alternative procedures which can be followed to find IRR. The simplest of them is described below:

1. Guess the value of $r$ and calculate the NPV of the project at that value.
2. If NPV is close to zero then IRR is equal to $r$.
3. If NPV is greater than 0 then increase $r$
4. If NPV is smaller than 0 then decrease $r$.
5. Recalculate NPV using the new value of $r$ and go back to step 2 .

## Example

Find the IRR of an investment having initial cash outflow of Rs. 250,000. The cash inflows during the first, second, third and fourth years are expected to be Rs. 66,000 , Rs. 78,000 , Rs. 92,000 and Rs. 105,000 respectively.

| Year | Cash Flow | DCF @ 10\% | Present <br> Value |
| :---: | :--- | :--- | :--- |
| 0 | $(250,000.00)$ | 1.00 | $(250,000.00)$ |
| 1 | $66,000.00$ | 0.9091 | $60,000.00$ |
| 2 | $78,000.00$ | 0.8264 | $64,462.81$ |
| 3 | $92,000.00$ | 0.7513 | $69,120.96$ |
| 4 | $105,000.00$ | 0.6830 | $71,716.41$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{1 5 , 3 0 0 . 1 8}$ |

NPV at $10 \%$ is $\quad=\quad$ Rs. $15,300.18$
Since NPV is greater than zero we have to increase discount rate,
When DCF 12\%

| Year | Cash Flow | DCF @ 12\% | Present <br> Value |
| :---: | :--- | :--- | :--- |
| 0 | $(250,000.00)$ | 1.00 | $(250,000.00)$ |
| 1 | $66,000.00$ | 0.8929 | $58,928.57$ |
| 2 | $78,000.00$ | 0.7972 | $62,181.12$ |
| 3 | $92,000.00$ | 0.7118 | $65,483.78$ |
| 4 | $105,000.00$ | 0.6355 | $66,729.40$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{3 , 3 2 2 . 8 7}$ |

NPV at $12 \%$ is $\quad=\quad$ Rs. $3,322.87$

But it is still greater than zero we have to further increase the discount rate,

When DCF 13\%

| Year | Cash Flow | DCF @ 13\% | Present <br> Value |
| :---: | :--- | :--- | :--- |
| 0 | $(250,000.00)$ | 1.00 | $(250,000.00)$ |
| 1 | $66,000.00$ | 0.8850 | $58,407.08$ |
| 2 | $78,000.00$ | 0.7831 | $61,085.44$ |
| 3 | $92,000.00$ | 0.6931 | $63,760.61$ |
| 4 | $105,000.00$ | 0.6133 | $64,398.47$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{( 2 , 3 4 8 . 4 0 )}$ |

NPV at $13 \%$ is $\quad=\quad$ Rs. $(2,348.40)$
When DCF 12.5\%

| Year | Cash Flow | DCF @ <br> 12.5\% | Present <br> Value |
| :---: | :--- | :--- | :--- |
| 0 | $(250,000.00)$ | 1.00 | $(250,000.00)$ |
| 1 | $66,000.00$ | 0.8889 | $58,666.67$ |
| 2 | $78,000.00$ | 0.7901 | $61,629.63$ |
| 3 | $92,000.00$ | 0.7023 | $64,614.54$ |
| 4 | $105,000.00$ | 0.6243 | $65,550.98$ |
|  | $\mathbf{N P V}$ |  | $\mathbf{4 6 1 . 8 2}$ |

NPV at $12.5 \%$ is $=\quad$ Rs. 461.82
Since NPV is fairly close to zero at $12.5 \%$

$$
\begin{aligned}
\text { Internal Rate of Return } & =\mathrm{R} 1 \%+\frac{\mathrm{NPV} 1 \times(\mathrm{R} 2-\mathrm{R} 1) \%}{(\mathrm{NPV} 1-\mathrm{NPV} 2)} \\
& =10 \%+\frac{\mathbf{1 5 , 3 0 0 . 1 8 \times ( 1 3 - 1 0 ) \%}}{(\mathbf{1 5 , 3 0 0 . 1 8 - ( - 2 3 4 8 . 4 0 ) )}} \\
& =10 \%+\frac{\mathbf{1 5 , 3 0 0 . 1 8 \times 5 \%}}{(\mathbf{1 5 , 3 2 6 . 8 2}+\mathbf{2 3 4 8 . 4})} \\
& =10 \%+2.6 \% \\
\text { IRR } & =\mathbf{1 2 . 6 \%}
\end{aligned}
$$

Note that in an exam situation a candidate could choose any discount rate to start. In choosing the discount rates, try to get one positive rate and one negative rate. Then apply IRR formula.
